Power Calculation

Practice 1

Compute the sums of the following expressions:

i)
$$1 \times 2 \times 3 + 2 \times 3 \times 4 + \cdots + 2016 \times 2017 \times 2018$$

ii)
$$\frac{1}{1\times2\times3} + \frac{1}{2\times3\times4} + \dots + \frac{1}{2016\times2017\times2018}$$

Practice 2

Let

$$f(r) = \sum_{j=2}^{2016} \frac{1}{j^r} = \frac{1}{2^r} + \frac{1}{3^r} + \dots + \frac{1}{2016^r}$$

Find the value of

$$\sum_{k=2}^{\infty} f(k)$$

Practice 3

Find the values of the following nested radicals:

i)
$$\sqrt{5 + \sqrt{5^2 + \sqrt{5^4 + \sqrt{5^8 + \dots}}}}$$

ii)
$$\sqrt{1+2\sqrt{1+3\sqrt{1+4\sqrt{1+\cdots}}}}$$

Practice 4

Without using a calculator, explain why the following approximation holds:

$$\sqrt{20 + \sqrt{20 + \sqrt{20}}} - \sqrt{20 - \sqrt{20 - \sqrt{20}}} \approx 1$$

Power Calculation

Practice 5

Find the length of the leading non-repeating block in the decimal expansion of $\frac{2017}{3\times5^{2016}}$. For example the length of the leading non-repeating block of $\frac{1}{6}=0.1\overline{6}$ is 1.

Practice 6

Simplify:

i)
$$C_n^0 + 2C_n^1 + 4C_n^2 + \cdots + 2^nC_n^n$$

ii)
$$C_n^1 + 2C_n^2 + 3C_n^3 + \dots + nC_n^n$$

iii)
$$C_n^0 + \frac{1}{2}C_n^1 + \frac{1}{3}C_n^2 + \dots + \frac{1}{n+1}C_n^n$$

iv)
$$(C_n^0)^2 + (C_n^1)^2 + (C_n^2)^2 \cdots + (C_n^n)^2$$

Practice 7

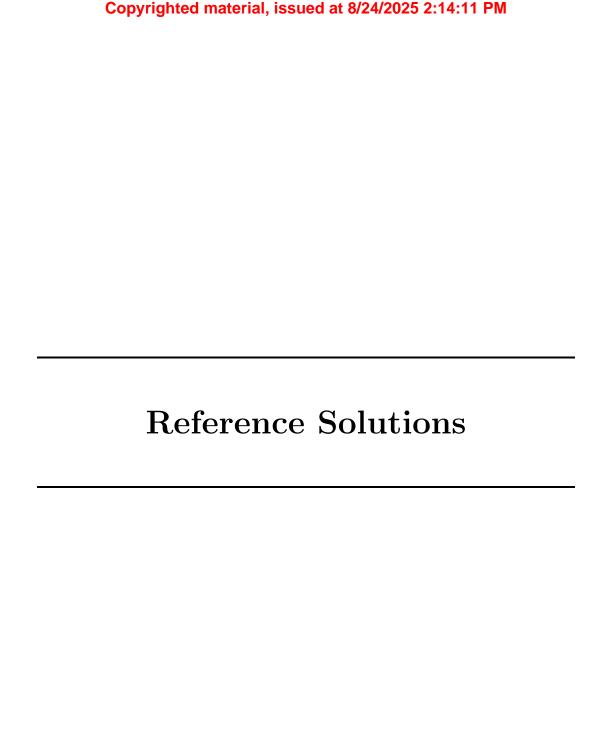

Simplify:

i)
$$\sin \theta + 2 \sin 2\theta + 3 \sin 3\theta \cdots + n \sin n\theta$$

ii)
$$\sin \theta + \frac{1}{2} \cdot \sin 2\theta + \frac{1}{4} \cdot \sin 3\theta + \cdots$$

Practice 8

Without using a calculator, find the value of $\cos \frac{\pi}{13} + \cos \frac{3\pi}{13} + \frac{9\pi}{13}$.

Power Calculation

Practice 1

Compute the sums of the following expressions:

i)
$$1 \times 2 \times 3 + 2 \times 3 \times 4 + \cdots + 2016 \times 2017 \times 2018$$

ii)
$$\frac{1}{1\times2\times3} + \frac{1}{2\times3\times4} + \cdots + \frac{1}{2016\times2017\times2018}$$

Note: as a practice, it is sufficient to give the answer as those in boxes.

i)
$$1 \times 2 \times 3 + 2 \times 3 \times 4 + \dots + 2016 \times 2017 \times 2018$$

$$= 3! \times \left(\frac{1 \times 2 \times 3}{3!} + \frac{2 \times 3 \times 4}{3!} + \dots + \frac{2016 \times 2017 \times 2018}{3!}\right)$$

$$= 3! \times \left(C_3^3 + C_4^3 + \dots + C_{2018}^3\right)$$

$$= 3! \times C_{2019}^4$$

$$= 4141845698256$$

$$ii) \qquad \frac{1}{1 \times 2 \times 3} + \frac{1}{2 \times 3 \times 4} + \dots + \frac{1}{2016 \times 2017 \times 2018}$$

$$= \frac{1}{2} \times \left(\frac{1}{1 \times 2} - \frac{1}{2 \times 3}\right) + \frac{1}{2} \times \left(\frac{1}{2 \times 3} - \frac{1}{3 \times 4}\right) + \dots + \frac{1}{2} \times \left(\frac{1}{2016 \times 2017} - \frac{1}{2017 \times 2018}\right)$$

$$= \frac{1}{2} \times \left(\frac{1}{1 \times 2} - \frac{1}{2017 \times 2018}\right)$$

$$= \frac{508788}{2035153}$$

Practice 2

Let

$$f(r) = \sum_{j=2}^{2016} \frac{1}{j^r} = \frac{1}{2^r} + \frac{1}{3^r} + \dots + \frac{1}{2016^r}$$

Find the value of

$$\sum_{k=2}^{\infty} f(k)$$

Power Calculation

$$\sum_{k=2}^{\infty} f(k) = f(2) + f(3) + f(4) + \cdots$$

$$= \frac{1}{2^2} + \frac{1}{3^2} + \cdots + \frac{1}{2016^2}$$

$$+ \frac{1}{2^3} + \frac{1}{3^3} + \cdots + \frac{1}{2016^3}$$

$$+ \frac{1}{2^4} + \frac{1}{3^4} + \cdots + \frac{1}{2016^4}$$

$$+ \cdots$$

$$= \left(\frac{1}{2^2} + \frac{1}{2^3} + \frac{1}{2^4} + \cdots\right)$$

$$+ \left(\frac{1}{3^2} + \frac{1}{3^3} + \frac{1}{3^4} + \cdots\right)$$

$$+ \cdots$$

$$+ \left(\frac{1}{2016^2} + \frac{1}{2016^3} + \frac{1}{2016^4} + \cdots\right)$$

$$= \frac{1}{2^2} \times \frac{1}{1 - 1/2} + \frac{1}{3^2} \times \frac{1}{1 - 1/3} + \cdots + \frac{1}{2016^2} \times \frac{1}{1 - 1/2016}$$

$$= \frac{1}{2 \times 1} + \frac{1}{3 \times 2} + \cdots + \frac{1}{2016 \times 2015}$$

$$= \left(\frac{1}{1} - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \cdots + \left(\frac{1}{2015} - \frac{1}{2016}\right)$$

$$= \frac{2015}{2016}$$

Practice 3

Find the values of the following nested radicals:

i)
$$\sqrt{5 + \sqrt{5^2 + \sqrt{5^4 + \sqrt{5^8 + \dots}}}}$$

ii)
$$\sqrt{1+2\sqrt{1+3\sqrt{1+4\sqrt{1+\cdots}}}}$$

i) First let's compute $\sqrt{1+\sqrt{1+\sqrt{1+\cdots}}}$.

Let
$$S = \sqrt{1 + \sqrt{1 + \sqrt{1 + \cdots}}} > 0$$
, we find $S^2 = 1 + S \implies S = \frac{\sqrt{5} + 1}{2}$. Then

$$\sqrt{5 + \sqrt{5^2 + \sqrt{5^4 + \sqrt{5^8 + \dots}}}} = \sqrt{5} \times \sqrt{1 + \sqrt{1 + \sqrt{1 + \dots}}} = \sqrt{5} \times \frac{\sqrt{5} + 1}{2} = \frac{5 + \sqrt{5}}{2}$$

Power Calculation

ii) Setting n=1 and x=2 in the Srinivasa Ramanujan identity below leads to the answer 3.

$$x + n = \sqrt{n^2 + x\sqrt{n^2 + (x+n)\sqrt{n^2 + (x+2n)\sqrt{\cdots}}}}$$

Practice 4

Without using a calculator, explain why the following approximation holds:

$$\sqrt{20 + \sqrt{20 + \sqrt{20}}} - \sqrt{20 - \sqrt{20 - \sqrt{20}}} \approx 1$$

The approximation holds because:

$$\sqrt{20 + \sqrt{20 + \sqrt{20}}} \approx \sqrt{20 + \sqrt{20 + \sqrt{20 + \sqrt{20 + \cdots}}}} = 5$$

$$\sqrt{20 - \sqrt{20 - \sqrt{20}}} \approx \sqrt{20 - \sqrt{20 - \sqrt{20 - \sqrt{20 - \cdots}}}} = 4$$

Practice 5

Find the length of the leading non-repeating block in the decimal expansion of $\frac{2017}{3\times5^{2016}}$. For example the length of the leading non-repeating block of $\frac{1}{6} = 0.1\overline{6}$ is 1.

It is easy to see that the given expression can be decomposed as

$$\frac{2017}{3 \times 5^{2016}} = \frac{A}{3} + \frac{B}{5^{2016}}$$

where both A and B are two constants.

It is clear that $\frac{A}{3}$ is a repeating decimal from the tenths digit. Meanwhile, $\frac{B}{5^{2016}}$ is a decimal of 2016 digits to the right of the decimal point. Therefore, the length of the leading non-repeating block is 2016.

Power Calculation

Practice 6

Simplify:

i)
$$C_n^0 + 2C_n^1 + 4C_n^2 + \dots + 2^nC_n^n$$

ii)
$$C_n^1 + 2C_n^2 + 3C_n^3 + \cdots + nC_n^n$$

iii)
$$C_n^0 + \frac{1}{2}C_n^1 + \frac{1}{3}C_n^2 + \dots + \frac{1}{n+1}C_n^n$$

iv)
$$(C_n^0)^2 + (C_n^1)^2 + (C_n^2)^2 \cdots + (C_n^n)^2$$

i) Setting x=2 in the following identity gives the answer of 3^n .

$$(1+x)^n = C_n^0 + C_n^1 x^2 + C_n^2 x^3 + \dots + C_n^n x^n$$

ii) Let
$$S = C_n^1 + 2C_n^2 + 3C_n^3 + \dots + nC_n^n$$
. Then

Therefore

$$2 \cdot S = n \times \left(C_n^0 + C_n^1 + \dots + C_n^{n-1} + C_n^n \right) = n \times 2^n \implies S = \boxed{n \times 2^{n-1}}$$

iii) By identity $\frac{1}{k+1}C_n^k = \frac{1}{n+1}C_{n+1}^{k+1}$, we have

$$C_n^0 + \frac{1}{2}C_n^1 + \frac{1}{3}C_n^2 + \dots + \frac{1}{n+1}C_n^n$$

$$= \frac{1}{n+1}C_{n+1}^1 + \frac{1}{n+1}C_{n+1}^2 + \dots + \frac{1}{n+1}C_{n+1}^{n+1}$$

$$= \frac{1}{n+1} \times \left(C_{n+1}^1 + C_{n+1}^2 + \dots + C_{n+1}^{n+1}\right)$$

$$= \frac{1}{n+1} \times (2^{n+1} - 1)$$

iv) By Vandermonde identity:

$$(C_n^0)^2 + (C_n^1)^2 + (C_n^2)^2 \cdot \dots + (C_n^n)^2$$

$$= C_n^0 C_n^n + C_n^1 C_n^{n-1} + C_n^2 C_n^{n-2} + \dots + C_n^n C_n^0$$

$$= C_{2n}^n$$

Power Calculation

Practice 7

Simplify:

i)
$$\sin \theta + 2 \sin 2\theta + 3 \sin 3\theta \cdots + n \sin n\theta$$

ii)
$$\sin \theta + \frac{1}{2} \cdot \sin 2\theta + \frac{1}{4} \cdot \sin 3\theta + \cdots$$

i) Let
$$S = \sin \theta + 2 \sin 2\theta + 3 \sin 3\theta \cdots + n \sin n\theta$$
. Then

$$2 \cdot \cos \theta \cdot S = \sin 2\theta + 2(\sin 3\theta + \sin \theta) + \dots + n(\sin(n+1)\theta + \sin(n-1)\theta)$$
$$= 2 \cdot S + n\sin(n+1)\theta - (n+1)\sin n\theta$$

Therefore

$$S = \boxed{\frac{(n+1)\sin n\theta - n\sin(n+1)\theta}{2(1-\cos\theta)}}$$

ii) Let $z = \cos \theta + i \sin \theta$, then

$$\left(\cos\theta + \frac{1}{2} \cdot \cos 2\theta + \frac{1}{4} \cdot \cos 3\theta + \cdots\right) + i\left(\sin\theta + \frac{1}{2} \cdot 2\sin 2\theta + \frac{1}{4} \cdot \sin 3\theta + \cdots\right)$$

$$= z + \frac{1}{2} \cdot z^2 + \frac{1}{4} \cdot z^3 + \cdots$$

$$= z/(1 - \frac{1}{2} \cdot z)$$

$$= \frac{2z}{2 - z}$$

$$= \frac{2(\cos\theta + i\sin\theta)}{(2 - \cos\theta) - i\sin\theta}$$

$$= \frac{2(\cos\theta + i\sin\theta)((2 - \cos\theta) + i\sin\theta)}{((2 - \cos\theta) - i\sin\theta)((2 - \cos\theta) + i\sin\theta)}$$

$$= \frac{(\cdots) + i(4\sin\theta)}{5 - 4\cos\theta}$$

Therefore the answer is $\frac{4\sin\theta}{5 - 4\cos\theta}$

Power Calculation

Practice 8

Without using a calculator, find the value of $\cos \frac{\pi}{13} + \cos \frac{3\pi}{13} + \frac{9\pi}{13}$.

This problem requires the following identity:

$$\cos\frac{\pi}{2n+1} + \cos\frac{3\pi}{2n+1} + \dots + \cos\frac{(2n-1)\pi}{2n+1} = \frac{1}{2}$$

Let $x = \cos \frac{\pi}{13} + \cos \frac{3\pi}{13} + \cos \frac{9\pi}{13}$ and $y = \cos \frac{5\pi}{13} + \cos \frac{7\pi}{13} + \cos \frac{11\pi}{13}$. Then

$$x + y = \frac{1}{2}$$
 by the identity above

and

$$xy = \left(\cos\frac{\pi}{13} + \cos\frac{3\pi}{13} + \cos\frac{9\pi}{13}\right) \left(\cos\frac{5\pi}{13} + \cos\frac{7\pi}{13} + \cos\frac{11\pi}{13}\right)$$

$$= -\frac{3}{2} \times \left(\cos\frac{\pi}{13} - \cos\frac{2\pi}{13} + \cos\frac{3\pi}{13} - \cos\frac{4\pi}{13} + \cos\frac{5\pi}{13} - \cos\frac{6\pi}{13}\right)$$

$$= -\frac{3}{2} \times \left(\cos\frac{\pi}{13} + \cos\frac{3\pi}{13} + \cos\frac{5\pi}{13} + \cos\frac{9\pi}{13} + \cos\frac{11\pi}{13}\right)$$

$$= -\frac{3}{2} \times \frac{1}{2}$$

$$= -\frac{3}{4}$$

Therefore x and y are two roots of the following equation:

$$t^2 - \frac{1}{2} \cdot t - \frac{3}{4} = 0$$

Clearly x > 0. Solving the above equation leads to $x = \boxed{\frac{1 + \sqrt{13}}{4}}$.
